

4/7 VSUS

Energy → the ability to do work & cause change

TYPES

- Potential → related to location/position
- Kinetic → related to movement

Law of conservation of Energy → energy cannot be created or destroyed, only transferred or transformed.

- The rubber disc had more elastic potential than the tennis ball.

- Newton's cradle → where the ball has the most potential NRG it has the least kinetic NRG → transfers potential to kinetic when it falls

- Gravitational potential Energy (G)

$$G = mgh$$

mass = m

9.82 m (acceleration) = g

h = height

4/7 VSUS

Energy \rightarrow the ability to do work & cause change

TYPES

- Potential \rightarrow related to location/position
- Kinetic \rightarrow related to movement

Law of conservation of Energy \rightarrow energy cannot be created or destroyed, only transferred or transformed.

- The rubber disc ^(\Rightarrow) had more elastic potential than the tennis ball.

- Newton's cradle ^(\ominus) \rightarrow where the ball has the most potential NRG it has the least kinetic NRG \rightarrow transfers potential to kinetic when it falls

- Gravitational potential Energy (G)

$$G = mgh$$

mass = m

9.8 $\frac{m}{s^2}$ (acceleration) = g

h = height
